Inverter Varispeed F7

Main Features of Varispeed F7 Inverter

Feature 1:

Precise control, functionality and flexibility

High grade and good concentricity

Yaskawa's open loop vector control allows an excellent torque characteristic at a speed ratio of 1:100. Hence at 0.5Hz, for example, more than 200% of the rated torque is available.

Three autotuning functions

- The proven autotuning function with motor rotating (no load) during measurement.
- New method which yields similarly good result with motor at a standstill.
- Measurement of the motor resistance for simple applications.

High slip braking (HSB)

Yaskawa's intelligent function allows up to 3 times faster braking without the use of a braking transistor or resistor.

Braking transistor

This transistor is built in as standard in inverters of up to 18.5kW, and is available as an external option for higher outputs. In conjunction with an external braking resistor it achieves very powerful braking.

Improved protective functions

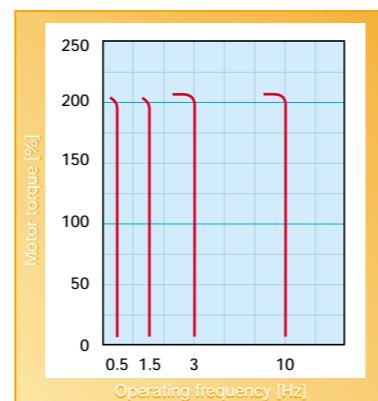

The high speed overcurrent limiting function allows virtually uninterrupted operation (no overcurrent tripping, restart after momentary power loss, motor stall prevention, attempted restart after malfunction, etc).

CASE (Custom Application Software Environment)

makes it easy to customize the Varispeed F7 to the user or application requirements if they are not covered by the extensive standard functions.

Speed search function

The Varispeed F7 determines the speed and direction of rotation of a coasting motor, then brings it to the required reference speed. This is carried out extremely smoothly in both directions.

Feature 2:

Ecologically friendly

Reliable energy saving function

The energy-saving control approaches the maximum efficiency. Highly-efficient, energy-saving operations are realized for any application using either the vector control or the V/f control.

Low noise operation

With the low noise carrier PWM control for heavy duty mode as well as with the high carrier PWM control for normal duty mode a considerable quiet motor operation is achievable.

Suppression of harmonic distortion

All inverters with an output power of 22 kW and higher have a double diode supply, for 12 pulse input, which makes it possible to suppress the harmonics to about 12%. They are also equipped with a built-in DC bus reactor. For the inverters below 22 kW the DC bus reactor is available as option.

Note: 12-pulse input requires a special transformer

Feature 3:

User-friendly installation and operation

Easy to operate

- The Varispeed F7 can be fully controlled using the digital operator. The operator is equipped with a parameter copy function and can even be used up to 3m away with a standard cable. The LED display can be read easily, even at a considerable distance.
- An optional LCD operator with plain text in 7 different languages and the same functions is available.

Clear hierarchy of menus for setting parameters

Easy operation for fast start up and maintenance.

Quick program

Simplifies the start-up procedure by showing the most important parameters only.

Modified Parameters

Easy troubleshooting by checking the parameters modified from the factory defaults.

Easily maintained

- The control terminal block can be disconnected from the motherboard. This enables replacement of the inverter without disconnecting the controlwiring.
- The inverter fan switches off when the motor is at a standstill. If necessary, it can be replaced without dismantling the unit.

Feature 4:

Global specification

Conformity with global standards for worldwide use

Certified to UL/cUL and CE

CE mark
for Europe

UL mark for Canada and the USA

Available worldwide

Worldwide service

Operation with commonly used mains voltages

- Series for 400V (three phase)
380 to 480V +10% -15%
- Series for 200V (three phase)
200 to 240V +10% - 15%

Global fieldbus standards supported

- RS-485/422 (MEMOBUS protocol) supported as standard
- Optional cards available for Profibus-DP, INTERBUS-S, CANopen and DeviceNet (LONworks, CC Link & ControlNet)

Description of digital operator

Overview of display and keypad

Data display

Menu button

Switches menu within the hierarchy.

Local/Remote button

Changes over from control with the digital operator to control via the terminal block.

JOG button

Enables RUN with JOG speed, which has highest priority.

FWD/REV button

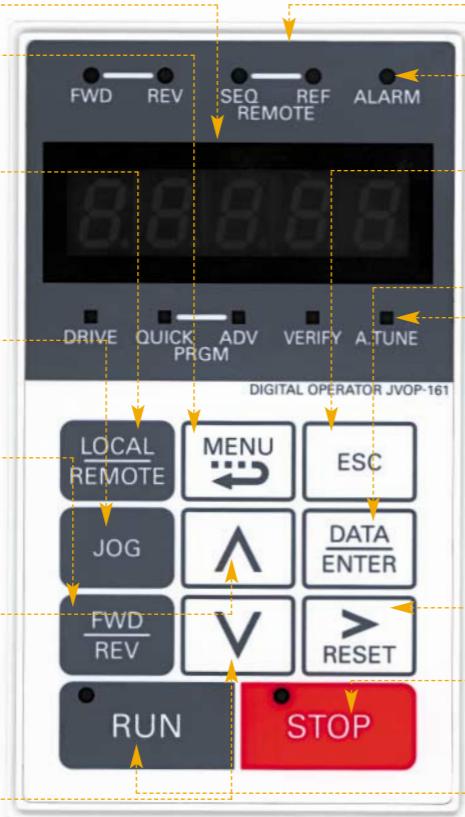

Reverses the direction of rotation of the motor.

Arrow up button

Increases the parameter number or data value.

Arrow down button

Decreases the parameter number or data value.

Varispeed F7

Digital operator

Status LEDs

One of these comes on to indicate the inverter status.

ESC button

Returns to previous menu in the hierarchy without saving.

Enter button

Saves parameter setting data. Entering a parameter number in the PRGM mode displays the associated data.

Reset button

Shifts the digit of a value that is selected to be changed resets operation when a fault has occurred (acknowledgement).

Stop button

Stops the motor.

Run button

Starts the motor. The LED in the top left corner of the button lights up to indicate that the motor is running.

Radio interference suppression filters for conformity with the EMC Directive (CE)

The radio interference filters tested by Yaskawa are listed below. The stipulations of the Operating Manual (YEG-TOE-S616-55.1) or separate EMC documentation relating to their connection must be followed to achieve proper electromagnetic compatibility (EMC).

Inverter model	Filter model	Current (A)	Weight (kg)	Dimensions WxHxD (mm)	Fit under yes/no
