Inverter Varispeed G7

Main Features of Varispeed G7 Inverter

Feature 1: 3 Level Control Technology

■ 400V frequency inverter solution

The first 400V frequency inverters with 3 level control technology are now available to approach sinusoidal output voltage. This technology helps to solve problems such as stressing of the insulation of motor windings by overvoltages (caused by travelling waves), and electrolytic corrosion of the bearings (caused by leakage currents via the motor shaft). It also considerably reduces motor acoustical noise and leakage currents (particularly with long motor cables).

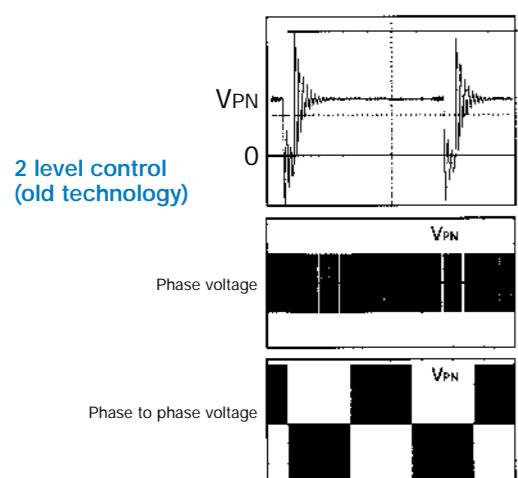

■ Advantages of 3 level control technology

1 Low voltage peaks

Lower voltage peaks increase the life of the motor by reducing the stress on the insulation of the motor windings. They also make operation with long cables readily possible.

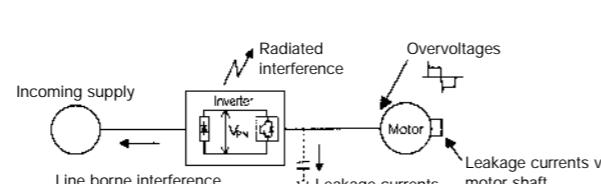

2 Low level of radio interference

Considerably reduced conducted emission caused by the inverter reduces the cost of line filters.

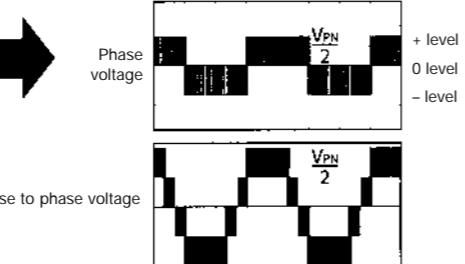

3 Quiet motor operation

The 3 level technology drastically reduces the noise due to magnetic transients in the motor.

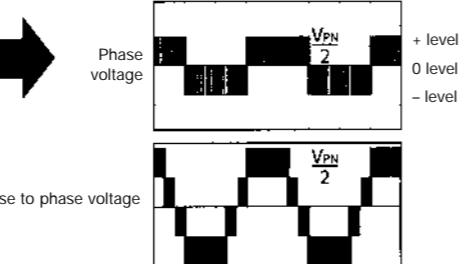

2 level control (old technology)

3 level control (new technology)

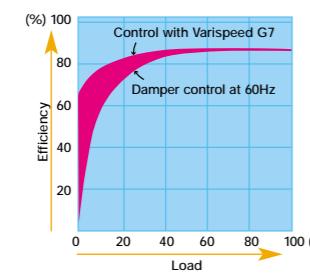

V PN

Feature 2: Ecologically friendly

■ Effective energy saving function

The energy-saving control approaches the maximum efficiency. High efficient, energy-saving operations are achieved for any applications either in vector or V/F control.

■ Suppression of harmonic distortion

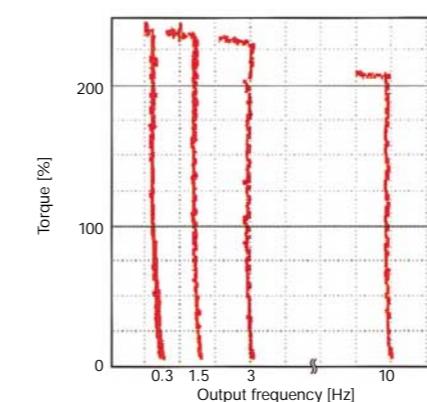

All inverters larger than 15kW are equipped with a DC bus reactor and second rectifier bridge as standard. In combination with a transformer with two secondary windings (star and delta), the harmonics can be suppressed to about 12% using the 12 pulse method.

Feature 3: Highly Dynamic and Precise Control

■ Excellent torque characteristic

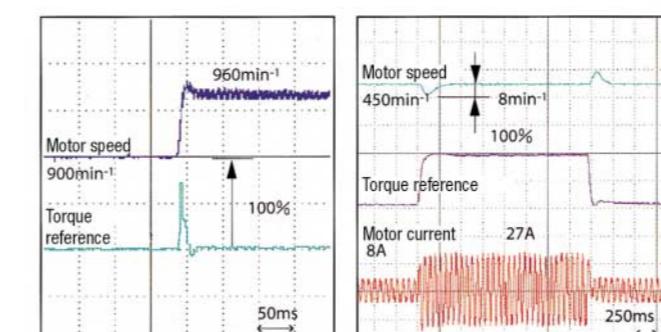

The new dual flux observation method improves the torque characteristic (150% at 0.3Hz for open loop vector control 2). 150% torque is available at 0rpm with pulse generator feedback.

High torque with a speed control range of 1:200
(after rotating autotuning in open loop vector mode)
[speed control range with pulse generator feedback 1:1000]

■ Extremely fast response

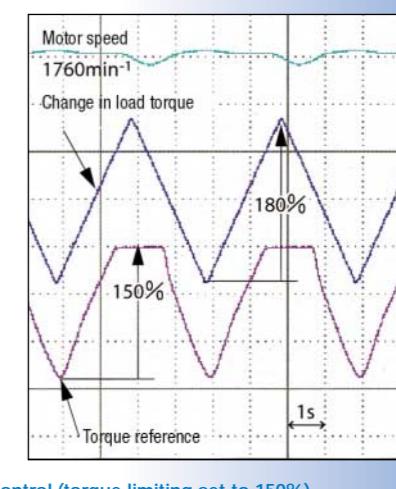

The model tracking control assures fast response even without PG (doubled in in-house comparison). With a PG you can make use of our unique highspeed current vector, rapidly responses speed reference changes (speed response 40 Hz/motor unit). Speed keeps constant even if load fluctuates.

Fast response to changes in speed (reference speed step response)
Handles sudden changes in load (speed characteristic with change in load)

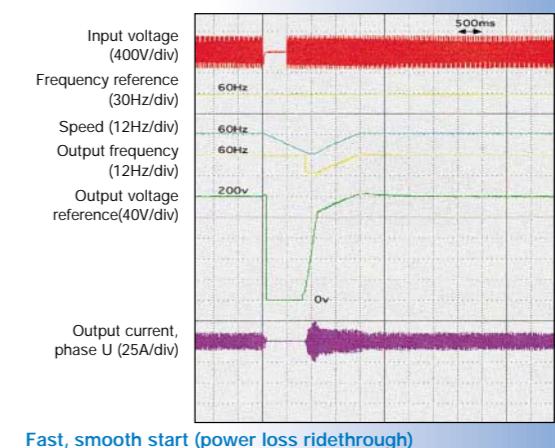

■ Accurate torque control

The precision of the limiting function allows accurate control of the output torque in order to protect machines and materials against sudden changes in load.

■ Very fast speed search function

This function reduces the recovery time after momentary power loss. Recovery is possible regardless of the direction of rotation.

■ Reliable protective function

Very fast and accurate current regulation functions support continuous operation by preventing overcurrent tripping. Power loss ridethrough, motor stall prevention and automatic restart after fault also support the uninterrupted operation. A motor thermistor can be evaluated using an analog input and protects the motor against overheating.

■ Simple method of autotuning

Another method of autotuning, with the motor shaft stationary, is now available as an alternative to the established rotating technique. This allows the performance of any make of motor to be optimised.

Main Features of Varispeed G7 Inverter

Feature 4: User friendly

■ Easy to operate

The 5 line, illuminated LCD display allows easy operation. The copy function provided by the removable operator makes it easy to copy a set of parameters from one inverter to another. The Quick Programming Mode makes start up easier. Parameters differing from the factory defaults can be read and altered by choosing Modified Constants from the menu.

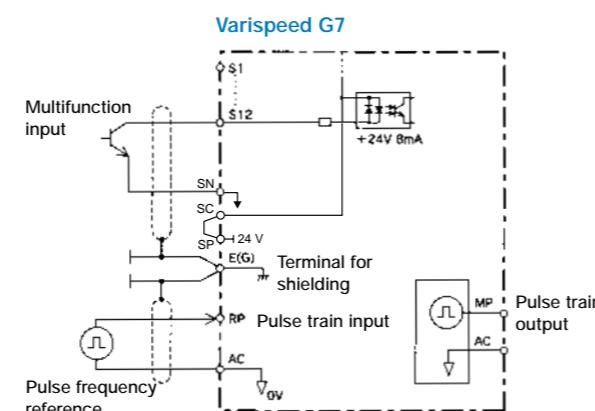

■ Straightforward maintenance and inspection

The removable control terminal block allows the inverter to be replaced without disconnecting the control lines. The cooling fans can be changed without dismantling the inverter. The operating time of the inverter and individual fans can be recorded and displayed.

■ Input and output terminals

The analog inputs and outputs are supplemented with a pulse train input and a pulse train output. 10 digital multifunction inputs and 5 digital multifunction outputs are available. Positive or negative (NPN/PNP) logic can be chosen for the digital inputs.

Feature 5: Customisable

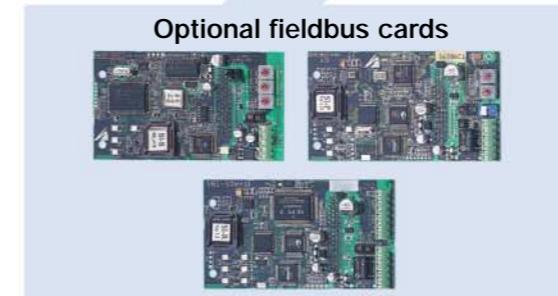

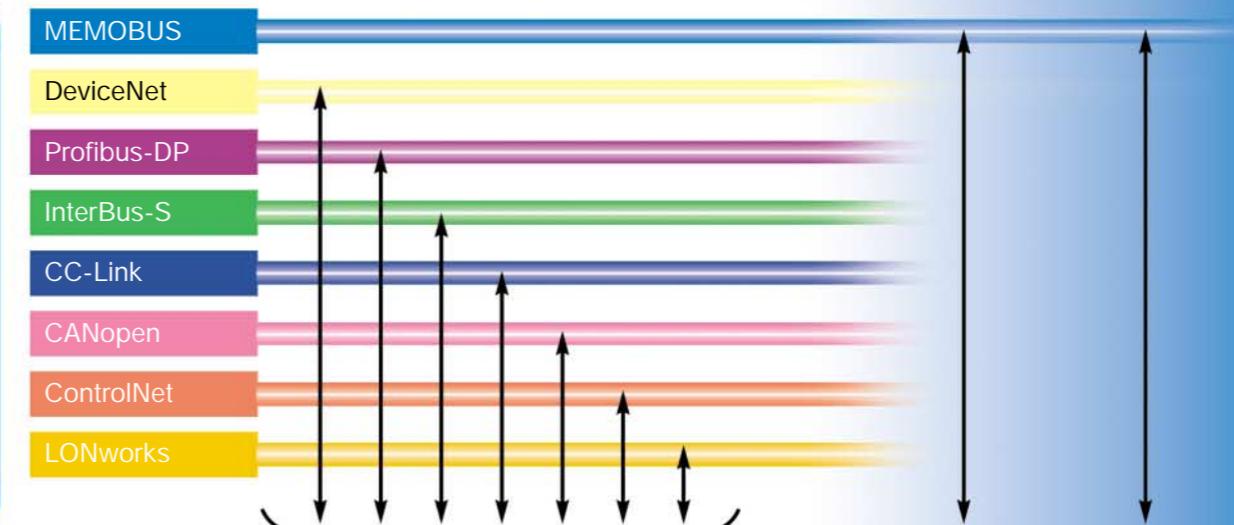

■ The internal flash memory allows enhanced configuration for special applications. (CASE = Custom Application Software Environment)

Feature 6: Global Specification

■ Support for global fieldbus standards

All inverters support the Memobus/Modbus protocol via an RS422/485 interface as standard. Optional fieldbus cards can be fitted to allow the Varispeed G7 to communicate with host systems for central control of production with minimum wiring.

Feldbus systems

■ Digital operator in seven languages

The illuminated 5 line LCD display allows operation in 7 languages: German, English, French, Italian, Japanese, Portuguese and Spanish.

■ Conformity with global standards for worldwide use

Certified to UL/cUL and CE

■ Operation with power supplies in common use worldwide

400V (three phase) series; 380 to 480V +10% -15%
200V (three phase) series; 200 to 240V +10% - 15%
DC supply and hence use of regenerative systems also possible

■ Worldwide service network

Our service network covers the USA, Europe, China, South East Asia and other regions to support your activities all over the world.

Description of Digital Operator

Overview of display and keypad

Data display

MENU button

Switches menu within the hierarchy.

LOCAL/REMOTE button

Switches between control with the digital operator and control via the terminal block.

JOG button

Enables JOG speed, which has top priority.

FWD/REV button

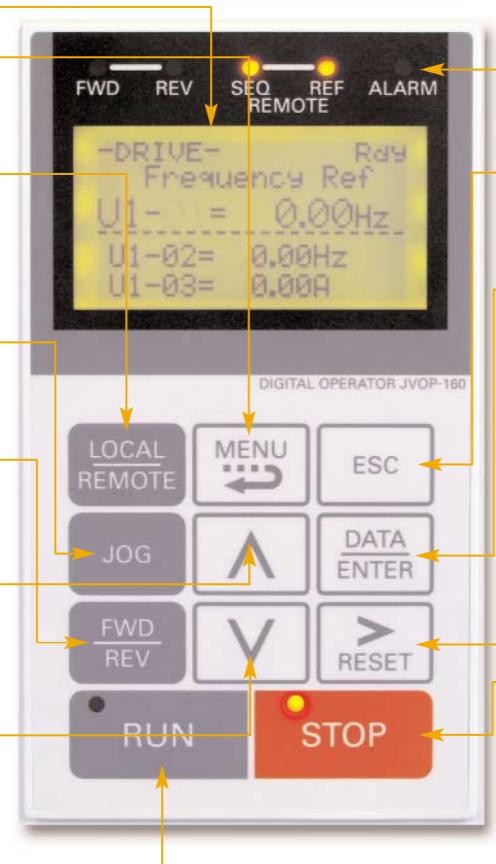

Reverses the direction of rotation of the motor.

ARROW UP button

Increases the parameter number or data value.

ARROW DOWN button

Decreases the parameter number or data value.

Status LEDs

Indicate the inverter status.

ESC button

Returns to previous menu in the hierarchy without saving.

ENTER button

Saves data when setting parameters. Entering a parameter number in the PRGM mode displays the associated data.

>/Reset button

Shifts the digit of the value to be changed. Pressing this button when a fault arises, resets the inverter (acknowledgement).

STOP button

Stops the motor.

RUN button

Starts the motor. The LED in the top left corner of the button lights up to indicate that the motor is running.

Varispeed G7

Standard Specifications General Data

	Specification
Control method	Sinusoidal PWM, 400V inverters with 3 level control flux vector control with pulse generator feedback; open loop vector control 1 and 2 V/f control, V/f control with pulse generator feedback
Carrier frequency	Up to 160kW: high carrier frequency 185 to 300kW: low carrier frequency
Max output frequency	400Hz
Speed control range	1:200 (open loop vector control 2) 1:1000 (flux vector control with pulse generator feedback)
Speed control accuracy	±0.2% (open loop vector control), ±0.02% (flux vector control with pulse generator feedback) at 25° C ± 10° C
Torque control	Possible with open loop vector control 2 and flux vector control with pulse generator feedback
Starting torque	150% at 0.3Hz (open loop vector control 2) 150% at 0rpm (flux vector control with pulse generator feedback)
Overload capacity	150% for 60 sec, 200% for 0.5 sec of the inverter rated current
Important functions	Power loss ridethrough, speed search, overtorque/undertorque detection, torque limits, 17 multi-step speed settings, 4 acceleration and deceleration times with ramp change, S-curve, autotuning (rotating and non-rotating). dwell function, cooling fan ON/OFF control, motor slip compensation, jump frequencies, High Slip Braking, energy saving function, PID controller (with sleep function), MEMOBUS communication (RS422/485), automatic restart after fault, copy function, droop control, torque control, changing between torque and speed control 2 switchable sets of motor parameters, etc
Analog inputs	2 x -10 to 10V, 1 x 4-20mA, 1 x pulse train input (11 bit + sign)
Analog outputs	2 x -10 to 10V or 4-20mA (9 bit), 1 x pulse train output
Digital inputs	12 inputs
Digital outputs	4 relay contacts, 2 open collector outputs
RS422/485	Provided, MEMOBUS protocol
Control terminals	Phoenix (terminal board can be fitted)
Fieldbus option	Possible
Digital operator	5 line LCD display with copy function
Protective functions	
Motor protection	Electronic thermal overload relay (PTC evaluation possible)
Overload protection	150% of rated inverter current for 60 seconds
Oversupply protection	200V inverter: trips if the DC bus circuit voltage exceeds 410V 400V inverter: trips if the DC bus circuit voltage exceeds 820V
Undervoltage protection	200V inverter: trips if the DC bus circuit voltage falls below 190V 400V inverter: trips if the DC bus circuit voltage falls below 380V
Earth fault	Protecting by electronic current monitoring
Overheating protection	Heat sink with thermistor monitoring
Charging indicator	Comes on if DC bus voltage exceeds 50V
Stall prevention	Stall prevention during acceleration and deceleration, and operation can be set separately
Braking transistor	Up to 15kW standard, 18.5 to 300kW optional
Ambient temperature during operation	-10 to +40°C (IP20) -10 to +45°C (IP00)
Relative humidity	Maximum of 95% (non-condensing)
Storage temperature	-20 to 60°C (briefly in transit)
Installation	In enclosed spaces (protected against corrosive gases and dust)
Installation altitude	Below 1000m (higher on request)
Vibration	10 bis 20 Hz, 9.8m/s² max.; 20 to 50 Hz, 1.96 m/s²
